

# DIE DENK-ALLMEND BEGINNT IN DÜBENDORF

Flughafen nach Neuhafen

Without water we die. Water is both our past and our future. Even in Switzerland where water appears to be abundant, flowing from the mountains into the valleys, water is in danger of running out. There is a future however where that is not guaranteed.

We propose to convert the Airport to a harbor, a place where water is the central element of this new city. At the two ends of the harbor two new docking stations are planned to deposit your vehicle. From the docking station you take an electric vehicle for all of the journey to the city.

Along the northern edge a reservoir is created with specific batteries (concrete slabs) which are replenished by wind turbines. Water stored in the slabs provides backing to the wind turbines with the water released into the reservoirs to be returned to the slabs for re-use. With enough power for over 1000 homes and associated businesses Neuhafen could be self sufficient in terms of water and power.

In between the two reservoirs are created 13 islands arranged following a spiral mapping of semi independent courtyards. Each lake fronts an all-sides provides for 100 to 200 residences per island. Additional power is provided using solar collection and other wind turbines. These provide for very attractive living conditions with private ready available to all. Taxis and businesses are located around the base and the rooftops of the courtyards.
